SafeOps AI — Enterprise System Testcase & Verification Specification

Problem Statement AO-04: 'Automation that is safe enough to leave switched on' • Cynefian 24-Hour AI-Ops Hackathon

Team ID: Idea Ignitors (XH-23)
Institution: GSSSIETW

Members: Babitha M, M Eshwar, Unnathi T M, Chaithanya N S

Public GitHub Repository: github.com/UnnathiManjunath/AI-Ops

Live Demonstration URL: f9350825bebff0.lhr.life

Overall Test Status: 12 / 12 PASS (100%)

PART 1: THE 4 CORE PROBLEM SUBSYSTEM TESTCASES (FIGURE 3 ARCHITECTURE SPECIFICATION)

TC-ID	Subsystem Under Test	Test Objective & Scenario	Pre-Condition & Initial Telemetry	Input / User Action (Dashboard UI)	Expected Physical State Change	Actual Result / Visual Proof	Status
TC-01	**Storage Disk** /var/log/app (NVMe SSD)	Verify automated Gzip compression of rotated logs based on Shannon entropy without human intervention.	Root partition at **94.2% CRITICAL**. 3 uncompressed text logs: app-access.log.1 (4.82GB), .2 (3.94GB), app-error.log.1 (2.21GB).	Navigate to Tab 1 (Disk Zipping) on Judge Showcase card. Click **'Execute Safe File Zipping (gzip)'**.	Evaluates Shannon entropy (H=0.38 < 0.45). Executes find ... gzip. Reclaims 18.2 GB storage.	Terminal exit code 0. Inspector transforms files to **.gz archives** (382MB, 314MB, 178MB). Telemetry drops to **62.4% HEALTHY**.	PASS
TC-02	**Storage Disk** /var/log/app (Reversibility)	Verify zero-loss reversible rollback using Gunzip when rollback is tested.	Files currently compressed as *.log.[1-9].gz. Disk usage at 62.4% Healthy.	Click **'Test Rollback (gunzip)'** button on Disk Showcase panel.	Executes find ... gunzip restoring raw UTF-8 lines. Reclaims 0 MB, restores original state.	Terminal streams uncompression. Files immediately revert back to uncompressed state (RAW 4.82 GB in red). Proves **zero data loss**.	PASS
TC-03	**Worker Pool** /proc/$PID (Host RAM)	Verify autonomous recovery of deadlocked background worker via graceful POSIX SIGTERM and PID revival.	Worker daemon celery@worker-03 stuck in THREADLOCK. Last AMQP heartbeat missed **240s ago**. Metric worker_status=0.0.	Navigate to Tab 2 (Worker Restart). Click **'Interactively Execute Worker Restart'**.	Sends POSIX SIGTERM with 10s task drain window, followed by systemctl restart celery-worker@worker-03.service.	Frozen PID 18294 terminated. New clean PID **21045** spawns with 1s active heartbeat. Metric switches to **HEALTHY (1.0)**.	PASS
TC-04	**Event Stream** RabbitMQ AMQP (Network Sockets)	Verify Kubernetes consumer autoscaling to drain traffic backlog without exhausting database connections.	Order processing queue backlog surges to **48,250 pending messages**. Only 3 consumer pods running at capacity.	Navigate to Tab 3 (Queue Scaling). Click **'Interactively Scale Queue Consumers'**.	Calculates required replicas: N = ceil(Backlog / 150*60) = 6 pods. Executes kubectl scale deployment/order-consumer --replicas=6.	Inspector updates from 3 to 6 active consumer pods. Backlog successfully drains to **3,400 msgs (NORMAL)**.	PASS
TC-05	**Edge Ingress** Nginx Keystore (TLS Memory)	Verify zero-downtime automated SSL/TLS certificate rotation via ACME DNS challenge and atomic symlink swap.	Production SSL certificate for api.production.internal expires in **2.0 Days**. SLA warning active.	Navigate to Tab 4 (SSL Rotation). Click **'Interactively Rotate Certificate'**.	Executes certbot renew --quiet && nginx -s reload. Atomic symlink swaps live key bundle with zero dropped connections.	Certificate validity updates to **90 Days Remaining**. Handshake probe verifies **TLS 1.3 SECURE (200 OK)**. 0 dropped sessions.	PASS

PART 2: SAFETY POLICY, HUMAN-IN-THE-LOOP & ITIL AUDIT GOVERNANCE TESTCASES

TC-ID	Feature / Module	Test Objective & Scenario	Input Telemetry / Trigger	Execution Action (User Flow)	Safety Guardrail & Rule Evaluation	Actual Result / Verification	Status
TC-06	**Human Gate** Lead SRE Sign-Off (Tier 3 Policy)	Verify system enforces mandatory human approval when incident involves irreversible database core dumps.	Fault Injector: Select **'Disk Overflow: DB Core Dump'** (/var/lib/mysql/core.*).	Click **'Analyze Fault & Diagnose Risk'**. Attempt remediation without approval.	Policy identifies high blast radius: deleting crash dumps destroys forensic crash data. Categorized as **Tier 3 (Human Gate Required)**.	Dashboard locks execution button. Displays authorization banner: *'Awaiting SRE Approval from Babitha M'*. Action blocked until approved.	**PASS**
TC-07	**Active Locks** Shannon Entropy & Kernel lsof	Verify system strictly protects active file descriptors and refuses to compress open locks.	File inventory contains daemon_process.lock held by PID 4092 and active streaming log app-access.log.	Execute selective or staged disk optimization pipeline.	Rule engine probes active file descriptors via lsof. Unlinking open locks causes unlinked inode leaks and daemon crash. Marked **PROTECTED**.	Active locks bypassed. Displayed with amber badge: **BLOCKED: ACTIVE KERNEL LOCK (PID 4092)**. System remains 100% crash-free.	**PASS**
TC-08	**Kill-Switch** Master Freeze (Cluster Fail-Safe)	Verify Master Kill-Switch immediately blocks all automated remediation actions cluster-wide.	Active incident present on dashboard. System metrics critical.	Toggle **'KILL SWITCH: OFF'** to **'KILL SWITCH: ACTIVE'** in header. Click 'Run Safe Remediation'.	Master safety policy checks kill_switch_active = 'true' in SQLite before any command dispatch. Halts execution plane immediately.	Execution blocked with error: *'EXECUTION BLOCKED: Master Kill-Switch is ACTIVE. All automated actions are frozen.'* Terminal logs block.	**PASS**
TC-09	**Runbook Parser** Prose AI Ingestion (Dynamic Rules)	Verify intelligent parsing of raw English prose runbook text into structured operational constraints.	Click **'Upload Runbook'** button in top navigation bar. Load 'Disk Logs Runbook' prose template.	Click **'Ingest & Activate Runbook'**.	Regex and AI parsing engine extracts Trigger (Disk > 85%), Encoded Safe Rules, Remediation Command, and Rollback Script. Saves to SQLite as **RB-11**.	Toast notifies: *'Runbook Ingested & Activated: RB-11'*. Runbook catalog updates immediately. Active fault scenario binds to new runbook.	**PASS**
TC-10	**Auto-Rollback** Post-Verification Probe Failure	Verify automatic execution of rollback script when post-remediation health check returns anomalous metric.	Active incident selected. Remediation command staged.	Click **'Simulate Failure & Test Rollback'** button.	Remediation engine simulates post-verification probe failure. Safety watchdog triggers zero-loss rollback script immediately without human lag.	Terminal displays alert: *'Health check failed! Subsystem metrics anomalous. Initiating automated zero-loss rollback...'* State restored to snapshot.	**PASS**
TC-11	**OS Explorer** Physical Windows Filesystem VFS	Verify system operates on real physical disk storage and triggers native Windows File Explorer.	Real physical files generated in simulated_system/var_log_app/ and simulated_system/archive/.	Click **'Open .GZ Archive in Windows Explorer'** button in Subsystem Inspector.	Flask backend issues native OS command explorer.exe pointing to real archive directory on local hard drive.	Windows File Explorer opens on desktop displaying physical **.gz compressed files** on disk. Proves files are real, not mocks.	**PASS**
TC-12	**ITIL Audit** Immutable Ledger & Compliance	Verify all actions, rollbacks, and kill-switch events are sealed with cryptographic change IDs and exportable.	Multiple remediations and rollbacks completed across demo run.	Scroll to Section 4 (ITIL Change Records Table). Click **'Download .DB'** or view audit rows.	SQLite inserts record with unique CHG-XXXX-XXXX, timestamp, actor, risk tier, command, outcome, and ITIL justification.	Audit table populates with real-time rows. Download delivers full SQLite database (**safeops_master.db**) with complete forensic audit trail.	**PASS**
